

OBJECTIVE: To provide colour samples of Goldseal Hot Spray and ready for use steel panels in Industrial Hot Spray Red, to hang in corrosive environments for performance monitoring and easy inspection.

COLOUR PANEL KITS: Where possible we use single pigments for colour stability.

There are 9 colours in the kit which are primarily designed for use by a Regional Licensee as reference panels. We do not anticipate these kits being spread widely throughout industry.

The Goldseal base compound is not colour controlled and therefore there are slight variations in colour both drum to drum and batch to batch. This means we can provide Goldseal in a variety of colours but we cannot match industry standard colours as Goldseal is not a paint. Red, brown, mid green, yellow and black are single pigment colours. Pale yellow, olive, grey and dark green are pigment mixes which will have more colour variation drum to drum.

CORROSION SITE PANELS. These kits come with 10 Red panels, galvanized mounting wire and snips.

When visiting a customer sometimes for the first time, it is simple to locate an area during a plant inspection where a panel can be hung in a corrosive zone where current coatings have reached the end of their service life.

These panels can be hung using the wire supplied or with the use of synthetic cable ties.

It is important to run an accurate data base concerning the date of panel deployment.

Replacement panels are available ex the New Zealand manufacturing and service facility on a 4 week lead time.
